Before you leave, why not register a free account, claim your free eBook; Por la Villa de Bend Virtualization and Infrastructure Resource Book Rr-112b-Virtualization-Infrastructure-Resource-Book-v2.pdf (download time: 1 minutes 1 seconds) Don't forget! You can still win this stuff! You can see the full raffle list on the prize page. Enjoy your future self!Q: Where do my cpu and memory go? I've just built a new development rig, and I'm quite new to the whole notion of computers. Anyways, I recently acquired an AMD FX-9590 processor (I'm using Windows 7 x64, by the way). I'm interested in finding where the cpud and memory go (and how) in order to figure out if it's important to keep it clean or not. I'm not a gamer by any means, and I'm mostly an Ubuntu user, so I'm not entirely sure what kind of performance I should expect. The processor is 12-cores (x4) @ 3.8Ghz, the memory is 32GB of DDR4-1600. I do play an occasional game, however. Is the hardware sufficient for development work? A: I have a video card with 3GB of RAM, so I know how much memory actually gets allocated to my computer. I'm pretty sure your FX-9590 is 128-bit architecture. This means, the physical address space for this processor is 256-bit. In 32-bit OSes, you have 4GB of address space, therefore you have 4GB - 3GB = 1GB available for applications. (This may be slightly different for 64-bit OSes, I'm not really sure). If you want to run a 64-bit OS, you may need to go for more memory, depending on what you're doing. The AMD FX-9590 has a TDP of 65W. You can see how much power the CPU uses by looking at the graph here. I think you can get away with a cooler if you're just running applications, not gaming. I'm currently running an AMD FX-8320, which has the same TDP, but it's 2GB, so I could 82157476af
